Questions

1. What did I do this week?

- Made adjustments to `read_articles` so that it supports multiple file inputs
- Updated the text generation function to accept parameters: sentence length and count
- Wrote unit tests for `read_articles` covering single and multiple file inputs, NaN handling and alternate column name acceptance.

2. How has the program progressed?

- The core functionality is working, the program can generate text of a specified length and sentence count.
- The generated text quality is still lacking and can be incoherent at times. Hopefully, I will have time to address this next week.

3. What did I learn this week/today?

- How to handle csv files with different encodings.
- What aspects to prioritise when creating tests for a function.

4. What remains unclear or has been challenging?

- It has been challenging determining why the unit tests for `read_articles` are failing (it appears to be due to delimiter management as some of the files have different separators).
- Although I've attempted to mitigate this issue by using `sep=None`, the behaviour remains unpredictable. Further investigation is required.

5. What will I do next?

- Resolve the unit test issues
- Continue working on unit tests for the remaining functions and other testing techniques.
- Work on the implementation and testing document
- Create a GUI
